Tresor Couture · automated end-to-end test report

Area	Admin console · Catalogue SEO
Test id	seo-catalogue-audit
Result	PASSED
Duration	0.0s
Executed	2026-08-14T09:15:53.032Z
Environment	Firebase Emulator Suite (Auth + Firestore) loading the production firestore.rules

WHAT THIS VERIFIES

The audit reads only our own product data and flags what stops a product ranking or a shopper trusting it: duplicate descriptions, SKU-code names, leaked importer notes, computed strike-through MRPs, base64 images, thin copy and missing imagery. No external SEO service is contacted.

REPRODUCE MANUALLY

1. Sign in as an admin and open `#/admin/seo`.
2. The summary reports how many products carry a critical issue.
3. Each card names the rule, the consequence, the fix, and the products it fires on.
4. Filter by Critical / Warning / Notice using the chips.

STEPS (7)

1 ✓ Duplicate descriptions detected across differing prices

Numbers are normalised, so a templated paragraph is caught even when the price differs.

No screenshot — data assertion.

2 ✓ Stock codes rejected as product names

HA3858, MO2029, NE1386-S31 and 6988 flagged; a real name passes.

No screenshot — data assertion.

3 ✓ Importer note flagged as customer-visible

Tooling output on a live product page is treated as critical.

No screenshot — data assertion.

4 ✓ Computed strike-through MRPs flagged, genuine ones left alone

price ÷ 0.7 is detected; an equal MRP and a real higher list price both pass.

No screenshot — data assertion.

5 ✓ Base64 images and missing images separated

A data URI has no URL, so it cannot be cached, CDN-served or indexed by Google Images.

No screenshot — data assertion.

6 ✓ A clean catalogue scores 100 with no critical issues

The score is the share of products with nothing critical — a count, not an invented index.

No screenshot — data assertion.

7 ✓ Empty catalogue handled

No division by zero on a fresh install.

No screenshot — data assertion.
